

VISHAL

Software Engineer – Application Software

dhankharvishal84@gmail.com | +91 7015619766 | linkedin.com/in/VishalDhankhar | github.com/Meloxy-tech

Summary

B.Tech Computer Science student with a strong foundation in Machine Learning, Deep Learning, NLP, and Computer Vision, complemented by full-stack development experience in React.js, Node.js, and PostgreSQL/Supabase. Seeking a Software Engineer – Application Software role to apply strong programming fundamentals, OOP, and applied problem-solving skills to build reliable, production-grade software.

Education

Vellore Institute of Technology (VIT)	2028 (Expected)
Bachelor of Technology (B.Tech) in Computer Science	CGPA: 8.4 / 10

Technical Skills

Programming Languages: Python, SQL, C, C++, Java

Frameworks & Libraries: React.js, Node.js, Express.js

Databases: PostgreSQL, Supabase

Core Concepts: Machine Learning, Deep Learning, Natural Language Processing (NLP), Computer Vision, Object-Oriented Programming (OOP), Computer Networks (TCP/IP)

Projects

Daily OS – Personal Productivity Web Platform

github.com/Meloxy-tech

- Engineered a unified productivity web application consolidating 4+ everyday utility modules – clock, notes, timer, and weather – into a single, cohesive interface.
- Built a responsive front end with **React.js**, structuring reusable components to keep each utility module independent, maintainable, and easy to extend.
- Developed the backend using **Node.js** and **Express.js**, exposing RESTful APIs to handle data operations for notes, timers, and weather requests.
- Designed and integrated a **PostgreSQL/Supabase** data layer to persist user notes and settings across sessions, enabling reliable state retention between visits.
- Applied core OOP and modular design principles to organize the codebase, improving readability and reducing duplication across utility apps.

Automatic Vehicle Parking System

github.com/Meloxy-tech/vehicle_parking_system-test-

- Built a console-based vehicle parking management system in **C++** using OOP design to automate vehicle entry, billing, and slot allocation.
- Implemented a tiered pricing engine charging 4 distinct hourly rates (Rs. 50 / 100 / 150 / 200) across 2-wheeler, 3-wheeler, 4-wheeler, and heavy-vehicle categories, computing final billing dynamically per transaction.
- Designed real-time slot tracking for 4 vehicle categories (50 slots each, 200 total capacity), decrementing availability on entry and flagging categories once full.
- Engineered persistent data storage with file I/O to log every transaction (contact, name, vehicle number, type, duration, price) to CSV and retrieve historical records on demand.
- Added a data-reset utility to clear transaction history and restore full slot capacity, along with input validation to handle invalid menu selections gracefully.

Areas of Interest

Machine Learning | Deep Learning | Natural Language Processing | Computer Vision | Full-Stack Web Development
